# FOODIEHUB

# ONLINE FOOD ORDERING WEBSITE

WEB DEVELOPMENT PROJECT REPORT

| | |
|---|---|
| **Project** | FoodieHub Online Food Ordering Website |
| **Technology** | HTML5 and CSS3 |
| **Project Type** | Front-end / Static Website |
| **Purpose** | Educational web development project |

Fresh food. Easy browsing. Simple order requests.

Prepared as a simple-English guide to the project, its design, and its visible browser output.

# 1. Introduction

FoodieHub is a sample online food ordering website. It presents food categories, popular dishes, special offers, customer reviews, and an order request form. The website is designed with a warm orange and cream colour theme. HTML5 organises the page content, while CSS3 is used for layout, colours, spacing, and responsive design.

# 2. Project Objectives

• Create an attractive homepage for a sample food ordering service.

• Display food categories such as pizza, burgers, biryani, and desserts.

• Show popular menu items with descriptions and sample prices.

• Highlight a promotional offer and customer reviews.

• Provide a form for preparing a sample order request.

• Practise HTML page structure and CSS-based web design.

# 3. Technologies Used

**HTML5:** Creates the website structure, including navigation, sections, images, menu cards, reviews, form fields, and footer.

**CSS3:** Styles the website with colours, typography, spacing, grids, cards, buttons, and responsive layouts.

**No JavaScript or database:** The supplied HTML references a separate stylesheet named **food.css**. The provided source contains HTML only. The form uses a mailto action and does not connect to an online ordering system or database.

# 4. Website Sections

## Header and Navigation

The navigation bar contains the FoodieHub logo and links to Home, Categories, Our Menu, Offers, and Reviews. An Order Now link takes the visitor to the menu.

## Hero Banner

The opening banner displays “Your favourite food, just a click away!”, a short introduction, an Explore Menu button, rating, and estimated delivery time.

## Restaurant Information

This section shows the sample restaurant name, location in Vijayawada, customer rating, delivery estimate, and average order value.

## Food Categories

Four category cards represent Pizza, Burgers, Biryani, and Desserts.

## Special Offers

An orange promotional panel displays a sample 20% discount for orders above ■499.

## Popular Menu

Six food cards display Margherita Pizza, Classic Burger, Chicken Biryani, Ice Cream Sundae, Farmhouse Pizza, and Cheese Burger with sample prices.

## Customer Reviews

Three sample testimonials show customer comments and star ratings.

## Place Your Order

The form asks for the customer name, email, food choice, quantity, and delivery address. It is a demonstration form, not a complete ordering system.

### Footer

The footer displays the FoodieHub name, a short tagline, and student project copyright text.

# 5. Important HTML and CSS Concepts

### Semantic HTML

Elements such as header, main, section, article, form, and footer organise the page into meaningful parts.

### Anchor Links

Links such as href="#menu" move the visitor to a section with the matching ID.

### Images and Alternative Text

The img element displays food pictures. The alt attribute provides a text description.

### Forms and Input Fields

The form uses text, email, number, select, and textarea fields to collect sample order details.

### CSS Grid and Flexbox

These CSS layout techniques can arrange cards and navigation items neatly.

### Responsive Design

CSS media queries can adjust the layout for smaller screens such as mobile phones.

### Hover Effects

CSS hover rules can add visual feedback when a visitor points to a link or button.

# 6. Website Output Screenshot

The following image is the browser output supplied with the project. It shows the hero banner, restaurant details, categories, offers, popular menu, reviews, order form, and footer.

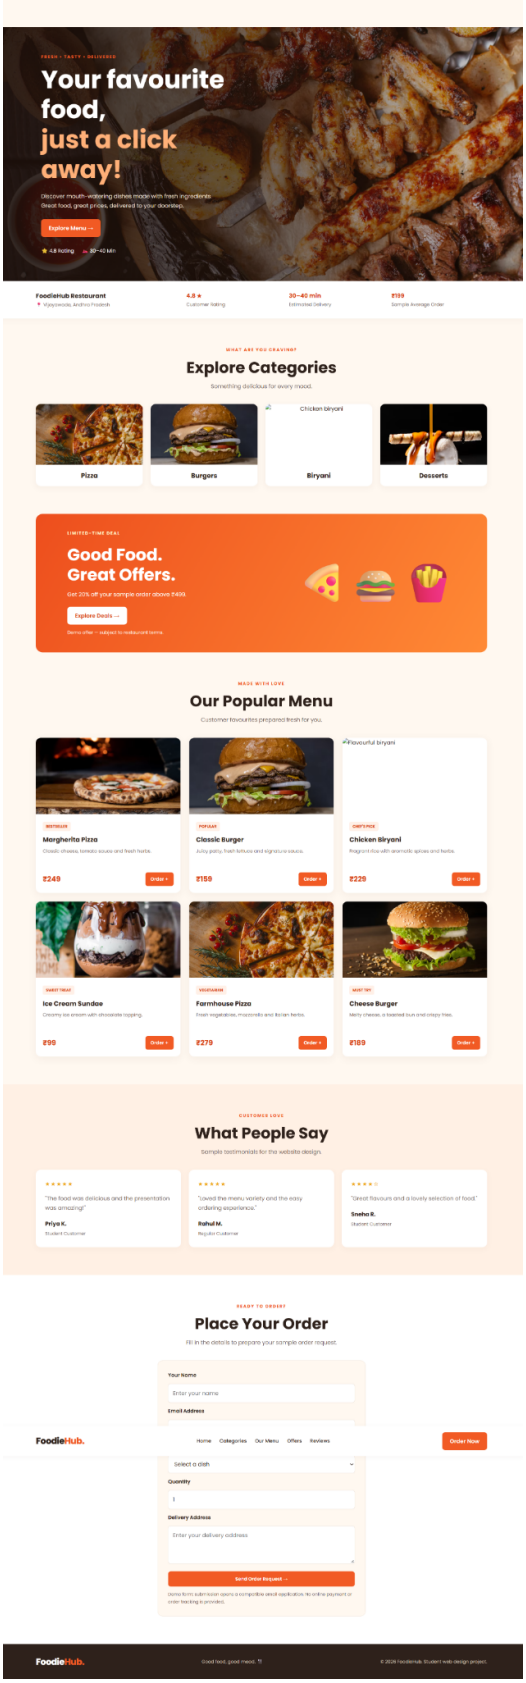

Figure 1. FoodieHub website output (user-supplied screenshot).

# 7. How the Website Works

• The browser reads the HTML file and builds the structure of the page.

• The HTML file loads the external stylesheet using the link to food.css.

• CSS rules control the appearance of the navigation, hero section, category cards, menu, reviews, form, and footer.

• Navigation links use section IDs to move to different parts of the same page.

• The order form collects details and uses a mailto action to open a compatible email application.

# 8. Observations and Limitations

• The HTML source refers to food.css, but the CSS file was not included in the supplied text. The report therefore includes the provided HTML source code only.

• The menu prices, ratings, delivery time, discount, testimonials, and restaurant information are sample project content.

• The order form uses orders@example.com as a placeholder email address. Replace it with an intended email address before real use.

• The mailto form depends on an email application being configured on the user's device.

• The website does not process online payments, store orders, or provide order tracking.

• The supplied screenshot shows a visual layout, but some image areas appear not to have loaded. Check image URLs and internet access before submission.

• A future version could add form validation, a backend, a database, payment integration, and order tracking.

# 9. Conclusion

FoodieHub demonstrates how HTML5 and CSS3 can be used to create a multi-section food ordering website. It includes food categories, menu cards, offers, customer reviews, and an order request form. The project provides practice with semantic HTML, links, images, forms, and front-end page organisation. Since it is a static student project, real ordering features would require additional backend and database development.

# 10. Quick Viva Questions

### What is the purpose of this project?

To display food categories, menu items, offers, reviews, and a sample order form.

### Which technologies are used?

HTML5 and CSS3.

### What is the use of the nav element?

It groups the main navigation links.

### What does href="#menu" do?

It moves the page to the element whose ID is menu.

### Why is the alt attribute used in images?

It provides alternative text if an image cannot be displayed and helps accessibility.

### Does the website process online payments?

No. The supplied project is a static front-end website.

### What is the purpose of the order form?

It collects sample customer and order details and opens an email application through mailto.

# Appendix A. Original HTML Source Code

The following source code is reproduced from the supplied FoodieHub HTML file. It references a separate file named food.css. That CSS file was not included in the supplied source text.
